

inform potential visitors of changes to, or suspension of, visitation programs.

- Clearly communicate any visitation program changes to incarcerated/detained persons, along with the reasons for them (including protecting their health and their family and community members' health).
- If suspending contact visits, provide alternate means (e.g., phone or video visitation) for incarcerated/detained individuals to engage with legal representatives, clergy, and other individuals with whom they have legal right to consult.

NOTE: Suspending visitation would be done in the interest of incarcerated/detained persons' physical health and the health of the general public. However, visitation is important to maintain mental health. If visitation is suspended, facilities should explore alternative ways for incarcerated/detained persons to communicate with their families, friends, and other visitors in a way that is not financially burdensome for them. See above suggestions for promoting non-contact visits.

- **Restrict non-essential vendors, volunteers, and tours from entering the facility.**

Management

If there has been a suspected COVID-19 case inside the facility (among incarcerated/detained persons, staff, or visitors who have recently been inside), begin implementing Management strategies while test results are pending. Essential Management strategies include placing cases and individuals with symptoms under medical isolation, quarantining their close contacts, and facilitating necessary medical care, while observing relevant infection control and environmental disinfection protocols and wearing recommended PPE.

Operations

- **Implement alternate work arrangements deemed feasible in the Operational Preparedness**
- **Suspend all transfers of incarcerated/detained persons to and from other jurisdictions and facilities (including work release where relevant), unless necessary for medical evaluation, medical isolation/quarantine, care, extenuating security concerns, or to prevent overcrowding.**
 - If a transfer is absolutely necessary, perform verbal screening and a temperature check as outlined in the Screening section below, before the individual leaves the facility. If an individual does not clear the screening process, delay the transfer and follow the protocol for a suspected COVID-19 case – including putting a face mask on the individual, immediately placing them under medical isolation, and evaluating them for possible COVID-19 testing. If the transfer must still occur, ensure that the receiving facility has capacity to appropriately isolate the individual upon arrival. Ensure that staff transporting the individual wear recommended PPE (see Table 1) and that the transport vehicle is cleaned thoroughly after transport.
- **If possible, consider quarantining all new intakes for 14 days before they enter the facility's general population (SEPARATELY from other individuals who are quarantined due to contact with a COVID-19 case).** Subsequently in this document, this practice is referred to as **routine intake quarantine**.
- **When possible, arrange lawful alternatives to in-person court appearances.**
- **Incorporate screening for COVID-19 symptoms and a temperature check into release planning.**
 - Screen all releasing individuals for COVID-19 symptoms and perform a temperature check. (See Screening section below.)
 - If an individual does not clear the screening process, follow the protocol for a suspected COVID-19 case – including putting a face mask on the individual, immediately placing them under medical isolation, and evaluating them for possible COVID-19 testing.
 - If the individual is released before the recommended medical isolation period is complete, discuss release of the individual with state, local, tribal, and/or territorial health departments to ensure safe medical transport and continued shelter and medical care, as part of release planning. Make direct linkages to community resources to ensure proper medical isolation and access to medical care.
 - Before releasing an incarcerated/detained individual with COVID-19 symptoms to a community-based facility, such as a homeless shelter, contact the facility's staff to ensure adequate time for them to prepare to continue medical isolation, or contact local public health to explore alternate housing options.
- **Coordinate with state, local, tribal, and/or territorial health departments.** 
 - When a COVID-19 case is suspected, work with public health to determine action. See Medical Isolation section below.
 - When a COVID-19 case is suspected or confirmed, work with public health to identify close contacts who should be placed under quarantine. See Quarantine section below.

- Facilities with limited onsite medical isolation, quarantine, and/or healthcare services should coordinate closely with state, local, tribal, and/or territorial health departments when they encounter a confirmed or suspected case, in order to ensure effective medical isolation or quarantine, necessary medical evaluation and care, and medical transfer if needed. See Facilities with Limited Onsite Healthcare Services section.

Hygiene

- Continue to ensure that hand hygiene supplies are well-stocked in all areas of the facility. (See above.)
- Continue to emphasize practicing good hand hygiene and cough etiquette. (See above.)

Cleaning and Disinfecting Practices

- Continue adhering to recommended cleaning and disinfection procedures for the facility at large. (See above.)
- Reference specific cleaning and disinfection procedures for areas where a COVID-19 case has spent time (below).

Medical Isolation of Confirmed or Suspected COVID-19 Cases

NOTE: Some recommendations below apply primarily to facilities with onsite healthcare capacity. Facilities without onsite healthcare capacity, or without sufficient space to implement effective medical isolation, should coordinate with local public health officials to ensure that COVID-19 cases will be appropriately isolated, evaluated, tested (if indicated), and given care.

- As soon as an individual develops symptoms of COVID-19, they should wear a face mask (if it does not restrict breathing) and should be immediately placed under medical isolation in a separate environment from other individuals.
- Keep the individual's movement outside the medical isolation space to an absolute minimum.
 - Provide medical care to cases inside the medical isolation space. See Infection Control and Clinical Care sections for additional details.
 - Serve meals to cases inside the medical isolation space.
 - Exclude the individual from all group activities.
 - Assign the isolated individual a dedicated bathroom when possible.
- Ensure that the individual is wearing a face mask at all times when outside of the medical isolation space, and whenever another individual enters. Provide clean masks as needed. Masks should be changed at least daily, and when visibly soiled or wet.
- Facilities should make every possible effort to place suspected and confirmed COVID-19 cases under medical isolation individually. Each isolated individual should be assigned their own housing space and bathroom where possible.

Cohorting should only be practiced if there are no other available options.

- If cohorting is necessary:
 - Only individuals who are laboratory confirmed COVID-19 cases should be placed under medical isolation as a cohort. Do not cohort confirmed cases with suspected cases or case contacts.
 - Unless no other options exist, do not house COVID-19 cases with individuals who have an undiagnosed respiratory infection.
 - Ensure that cohorted cases wear face masks at all times.
- In order of preference, individuals under medical isolation should be housed:
 - Separately, in single cells with solid walls (i.e., not bars) and solid doors that close fully
 - Separately, in single cells with solid walls but without solid doors
 - As a cohort, in a large, well-ventilated cell with solid walls and a solid door that closes fully. Employ social distancing strategies related to housing in the Prevention section above.
 - As a cohort, in a large, well-ventilated cell with solid walls but without a solid door. Employ social distancing strategies related to housing in the Prevention section above.
 - As a cohort, in single cells without solid walls or solid doors (i.e., cells enclosed entirely with bars), preferably with an empty cell between occupied cells. (Although individuals are in single cells in this scenario, the airflow between cells essentially makes it a cohort arrangement in the context of COVID-19.)
 - As a cohort, in multi-person cells without solid walls or solid doors (i.e., cells enclosed entirely with bars), preferably with an empty cell between occupied cells. Employ social distancing strategies related to housing in the Prevention section above.

- Safely transfer individual(s) to another facility with available medical isolation capacity in one of the above arrangements
(NOTE – Transfer should be avoided due to the potential to introduce infection to another facility; proceed only if no other options are available.)

If the ideal choice does not exist in a facility, use the next best alternative.

- **If the number of confirmed cases exceeds the number of individual medical isolation spaces available in the facility, be especially mindful of cases who are at higher risk of severe illness from COVID-19.** Ideally, they should not be cohorted with other infected individuals. If cohorting is unavoidable, make all possible accommodations to prevent transmission of other infectious diseases to the higher-risk individual. (For example, allocate more space for a higher-risk individual within a shared medical isolation space.)
 - Persons at higher risk may include older adults and persons of any age with serious underlying medical conditions such as lung disease, heart disease, and diabetes. See CDC's website for a complete list, and check regularly for updates as more data become available to inform this issue.
 - Note that incarcerated/detained populations have higher prevalence of infectious and chronic diseases and are in poorer health than the general population, even at younger ages.
- **Custody staff should be designated to monitor these individuals exclusively where possible.** These staff should wear recommended PPE as appropriate for their level of contact with the individual under medical isolation (see PPE section below) and should limit their own movement between different parts of the facility to the extent possible.
- **Minimize transfer of COVID-19 cases between spaces within the healthcare unit.**
- **Provide individuals under medical isolation with tissues and, if permissible, a lined no-touch trash receptacle.** Instruct them to:
 - **Cover** their mouth and nose with a tissue when they cough or sneeze
 - **Dispose** of used tissues immediately in the lined trash receptacle
 - **Wash hands** immediately with soap and water for at least 20 seconds. If soap and water are not available, clean hands with an alcohol-based hand sanitizer that contains at least 60% alcohol (where security concerns permit). Ensure that hand washing supplies are continually restocked.
- **Maintain medical isolation until all the following criteria have been met. Monitor the CDC website for updates to these criteria.**
 - **For individuals who will be tested to determine if they are still contagious:**
 - The individual has been free from fever for at least 72 hours without the use of fever-reducing medications **AND**
 - The individual's other symptoms have improved (e.g., cough, shortness of breath) **AND**
 - The individual has tested negative in at least two consecutive respiratory specimens collected at least 24 hours apart
 - **For individuals who will NOT be tested to determine if they are still contagious:**
 - The individual has been free from fever for at least 72 hours without the use of fever-reducing medications **AND**
 - The individual's other symptoms have improved (e.g., cough, shortness of breath) **AND**
 - At least 7 days have passed since the first symptoms appeared
 - **For individuals who had a confirmed positive COVID-19 test but never showed symptoms:**
 - At least 7 days have passed since the date of the individual's first positive COVID-19 test **AND**
 - The individual has had no subsequent illness
- **Restrict cases from leaving the facility while under medical isolation precautions, unless released from custody or if a transfer is necessary for medical care, infection control, lack of medical isolation space, or extenuating security concerns.**
 - If an incarcerated/detained individual who is a COVID-19 case is released from custody during their medical isolation period, contact public health to arrange for safe transport and continuation of necessary medical care and medical isolation as part of release planning.

Cleaning Spaces where COVID-19 Cases Spent Time

- **Thoroughly clean and disinfect all areas where the confirmed or suspected COVID-19 case spent time.** Note – these protocols apply to suspected cases as well as confirmed cases, to ensure adequate disinfection in the event that the

suspected case does, in fact, have COVID-19. Refer to the Definitions section for the distinction between confirmed and suspected cases.

- Close off areas used by the infected individual. If possible, open outside doors and windows to increase air circulation in the area. Wait as long as practical, up to 24 hours under the poorest air exchange conditions (consult CDC Guidelines for Environmental Infection Control in Health-Care Facilities for wait time based on different ventilation conditions), before beginning to clean and disinfect, to minimize potential for exposure to respiratory droplets.
- Clean and disinfect all areas (e.g., cells, bathrooms, and common areas) used by the infected individual, focusing especially on frequently touched surfaces (see list above in Prevention section).
- **Hard (non-porous) surface cleaning and disinfection**
 - If surfaces are dirty, they should be cleaned using a detergent or soap and water prior to disinfection.
 - For disinfection, most common EPA-registered household disinfectants should be effective. Choose cleaning products based on security requirements within the facility.
 - Consult a list of products that are EPA-approved for use against the virus that causes COVID-19 [\[link\]](#). Follow the manufacturer's instructions for all cleaning and disinfection products (e.g., concentration, application method and contact time, etc.).
 - Diluted household bleach solutions can be used if appropriate for the surface. Follow the manufacturer's instructions for application and proper ventilation, and check to ensure the product is not past its expiration date. Never mix household bleach with ammonia or any other cleanser. Unexpired household bleach will be effective against coronaviruses when properly diluted. Prepare a bleach solution by mixing:
 - 5 tablespoons (1/3rd cup) bleach per gallon of water or
 - 4 teaspoons bleach per quart of water
- **Soft (porous) surface cleaning and disinfection**
 - For soft (porous) surfaces such as carpeted floors and rugs, remove visible contamination if present and clean with appropriate cleaners indicated for use on these surfaces. After cleaning:
 - If the items can be laundered, launder items in accordance with the manufacturer's instructions using the warmest appropriate water setting for the items and then dry items completely.
 - Otherwise, use products that are EPA-approved for use against the virus that causes COVID-19 [\[link\]](#) and are suitable for porous surfaces.
- **Electronics cleaning and disinfection**
 - For electronics such as tablets, touch screens, keyboards, and remote controls, remove visible contamination if present.
 - Follow the manufacturer's instructions for all cleaning and disinfection products.
 - Consider use of wipeable covers for electronics.
 - If no manufacturer guidance is available, consider the use of alcohol-based wipes or spray containing at least 70% alcohol to disinfect touch screens. Dry surfaces thoroughly to avoid pooling of liquids.

Additional information on cleaning and disinfection of communal facilities such can be found on CDC's website.

- **Ensure that staff and incarcerated/detained persons performing cleaning wear recommended PPE.** (See PPE section below.)
- **Food service items.** Cases under medical isolation should throw disposable food service items in the trash in their medical isolation room. Non-disposable food service items should be handled with gloves and washed with hot water or in a dishwasher. Individuals handling used food service items should clean their hands after removing gloves.
- **Laundry from a COVID-19 cases can be washed with other individuals' laundry.**
 - Individuals handling laundry from COVID-19 cases should wear disposable gloves, discard after each use, and clean their hands after.
 - Do not shake dirty laundry. This will minimize the possibility of dispersing virus through the air.
 - Launder items as appropriate in accordance with the manufacturer's instructions. If possible, launder items using the warmest appropriate water setting for the items and dry items completely.
 - Clean and disinfect clothes hampers according to guidance above for surfaces. If permissible, consider using a bag liner that is either disposable or can be laundered.
- **Consult cleaning recommendations above to ensure that transport vehicles are thoroughly cleaned after carrying a confirmed or suspected COVID-19 case.**

Quarantining Close Contacts of COVID-19 Cases

NOTE: Some recommendations below apply primarily to facilities with onsite healthcare capacity. Facilities without onsite healthcare capacity, or without sufficient space to implement effective quarantine, should coordinate with local public health officials to ensure that close contacts of COVID-19 cases will be effectively quarantined and medically monitored.

- **Incarcerated/detained persons who are close contacts of a confirmed or suspected COVID-19 case (whether the case is another incarcerated/detained person, staff member, or visitor) should be placed under quarantine for 14 days (see CDC guidelines).**
 - If an individual is quarantined due to contact with a suspected case who is subsequently tested for COVID-19 and receives a negative result, the quarantined individual should be released from quarantine restrictions.
- **In the context of COVID-19, an individual (incarcerated/detained person or staff) is considered a close contact if they:**
 - Have been within approximately 6 feet of a COVID-19 case for a prolonged period of time **OR**
 - Have had direct contact with infectious secretions of a COVID-19 case (e.g., have been coughed on)

Close contact can occur while caring for, living with, visiting, or sharing a common space with a COVID-19 case. Data to inform the definition of close contact are limited. Considerations when assessing close contact include the duration of exposure (e.g., longer exposure time likely increases exposure risk) and the clinical symptoms of the person with COVID-19 (e.g., coughing likely increases exposure risk, as does exposure to a severely ill patient).

- **Keep a quarantined individual's movement outside the quarantine space to an absolute minimum.**
 - Provide medical evaluation and care inside or near the quarantine space when possible.
 - Serve meals inside the quarantine space.
 - Exclude the quarantined individual from all group activities.
 - Assign the quarantined individual a dedicated bathroom when possible.
- **Facilities should make every possible effort to quarantine close contacts of COVID-19 cases individually.** Cohorting multiple quarantined close contacts of a COVID-19 case could transmit COVID-19 from those who are infected to those who are uninfected. Cohorting should only be practiced if there are no other available options.
 - If cohorting of close contacts under quarantine is absolutely necessary, symptoms of all individuals should be monitored closely, and individuals with symptoms of COVID-19 should be placed under medical isolation
 - If an entire housing unit is under quarantine due to contact with a case from the same housing unit, the entire housing unit may need to be treated as a cohort and quarantine in place.
 - Some facilities may choose to quarantine all new intakes for 14 days before moving them to the facility's general population as a general rule (not because they were exposed to a COVID-19 case). Under this scenario, avoid mixing individuals quarantined due to exposure to a COVID-19 case with individuals undergoing routine intake quarantine.
 - If at all possible, do not add more individuals to an existing quarantine cohort after the 14-day quarantine clock has started.
- **If the number of quarantined individuals exceeds the number of individual quarantine spaces available in the facility, be especially mindful of those who are at higher risk of severe illness from COVID-19.** Ideally, they should not be cohorted with other quarantined individuals. If cohorting is unavoidable, make all possible accommodations to reduce exposure risk for the higher-risk individuals. (For example, intensify social distancing strategies for higher-risk individuals.)
- **In order of preference, multiple quarantined individuals should be housed:**
 - Separately, in single cells with solid walls (i.e., not bars) and solid doors that close fully
 - Separately, in single cells with solid walls but without solid doors
 - As a cohort, in a large, well-ventilated cell with solid walls, a solid door that closes fully, and at least 6 feet of personal space assigned to each individual in all directions
 - As a cohort, in a large, well-ventilated cell with solid walls and at least 6 feet of personal space assigned to each individual in all directions, but without a solid door
 - As a cohort, in single cells without solid walls or solid doors (i.e., cells enclosed entirely with bars), preferably with an empty cell between occupied cells creating at least 6 feet of space between individuals. (Although individuals are in single cells in this scenario, the airflow between cells essentially makes it a cohort arrangement in the context of COVID-19.)
 - As a cohort, in multi-person cells without solid walls or solid doors (i.e., cells enclosed entirely with bars), preferably with an empty cell between occupied cells. Employ social distancing strategies related to housing in the Prevention section to maintain at least 6 feet of space between individuals housed in the same cell

- As a cohort, in individuals' regularly assigned housing unit but with no movement outside the unit (if an entire housing unit has been exposed). Employ social distancing strategies related to housing in the Prevention section above to maintain at least 6 feet of space between individuals.
- Safely transfer to another facility with capacity to quarantine in one of the above arrangements (NOTE – Transfer should be avoided due to the potential to introduce infection to another facility; proceed only if no other options are available.)
- **Quarantined individuals should wear face masks if feasible based on local supply, as source control, under the following circumstances** (see PPE section and Table 1):
 - If cohorted, quarantined individuals should wear face masks at all times (to prevent transmission from infected to uninfected individuals).
 - If quarantined separately, individuals should wear face masks whenever a non-quarantined individual enters the quarantine space.
 - All quarantined individuals should wear a face mask if they must leave the quarantine space for any reason.
 - Asymptomatic individuals under routine intake quarantine (with no known exposure to a COVID-19 case) do not need to wear face masks.
- **Staff who have close contact with quarantined individuals should wear recommended PPE if feasible based on local supply, feasibility, and safety within the scope of their duties** (see PPE section and Table 1).
 - Staff supervising asymptomatic incarcerated/detained persons under routine intake quarantine (with no known exposure to a COVID-19 case) do not need to wear PPE.
- **Quarantined individuals should be monitored for COVID-19 symptoms twice per day, including temperature checks.**
 - If an individual develops symptoms, they should be moved to medical isolation immediately and further evaluated. (See Medical Isolation section above.)
 - See Screening section for a procedure to perform temperature checks safely on asymptomatic close contacts of COVID-19 cases.
- **If an individual who is part of a quarantined cohort becomes symptomatic:**
 - **If the individual is tested for COVID-19 and tests positive:** the 14-day quarantine clock for the remainder of the cohort must be reset to 0.
 - **If the individual is tested for COVID-19 and tests negative:** the 14-day quarantine clock for this individual and the remainder of the cohort does not need to be reset. This individual can return from medical isolation to the quarantined cohort for the remainder of the quarantine period.
 - **If the individual is not tested for COVID-19:** the 14-day quarantine clock for the remainder of the cohort must be reset to 0.
- **Restrict quarantined individuals from leaving the facility (including transfers to other facilities) during the 14-day quarantine period, unless released from custody or a transfer is necessary for medical care, infection control, lack of quarantine space, or extenuating security concerns.**
- **Quarantined individuals can be released from quarantine restrictions if they have not developed symptoms during the 14-day quarantine period.**
- **Meals should be provided to quarantined individuals in their quarantine spaces.** Individuals under quarantine should throw disposable food service items in the trash. Non-disposable food service items should be handled with gloves and washed with hot water or in a dishwasher. Individuals handling used food service items should clean their hands after removing gloves.
- **Laundry from quarantined individuals can be washed with other individuals' laundry.**
 - Individuals handling laundry from quarantined persons should wear disposable gloves, discard after each use, and clean their hands after.
 - Do not shake dirty laundry. This will minimize the possibility of dispersing virus through the air.
 - Launder items as appropriate in accordance with the manufacturer's instructions. If possible, launder items using the warmest appropriate water setting for the items and dry items completely.
 - Clean and disinfect clothes hampers according to guidance above for surfaces. If permissible, consider using a bag liner that is either disposable or can be laundered.

Management of Incarcerated/Detained Persons with COVID-19 Symptoms

NOTE: Some recommendations below apply primarily to facilities with onsite healthcare capacity. Facilities without onsite healthcare capacity or without sufficient space for medical isolation should coordinate with local public health officials to ensure that suspected COVID-19 cases will be effectively isolated, evaluated, tested (if indicated), and given care.

- If possible, designate a room near each housing unit for healthcare staff to evaluate individuals with COVID-19 symptoms, rather than having them walk through the facility to be evaluated in the medical unit.
- Incarcerated/detained individuals with COVID-19 symptoms should wear a face mask and should be placed under medical isolation immediately. Discontinue the use of a face mask if it inhibits breathing. See Medical Isolation section above.
- Medical staff should evaluate symptomatic individuals to determine whether COVID-19 testing is indicated. Refer to CDC guidelines for information on evaluation and testing. See Infection Control and Clinical Care sections below as well.
- If testing is indicated (or if medical staff need clarification on when testing is indicated), contact the state, local, tribal, and/or territorial health department. Work with public health or private labs as available to access testing supplies or services.
 - If the COVID-19 test is positive, continue medical isolation. (See Medical Isolation section above.)
 - If the COVID-19 test is negative, return the individual to their prior housing assignment unless they require further medical assessment or care.

Management Strategies for Incarcerated/Detained Persons without COVID-19 Symptoms

- Provide clear information to incarcerated/detained persons about the presence of COVID-19 cases within the facility, and the need to increase social distancing and maintain hygiene precautions.
 - Consider having healthcare staff perform regular rounds to answer questions about COVID-19.
 - Ensure that information is provided in a manner that can be understood by non-English speaking individuals and those with low literacy, and make necessary accommodations for those with cognitive or intellectual disabilities and those who are deaf, blind, or low-vision.
- Implement daily temperature checks in housing units where COVID-19 cases have been identified, especially if there is concern that incarcerated/detained individuals are not notifying staff of symptoms. See Screening section for a procedure to safely perform a temperature check.
- Consider additional options to intensify social distancing within the facility.

Management Strategies for Staff

- Provide clear information to staff about the presence of COVID-19 cases within the facility, and the need to enforce social distancing and encourage hygiene precautions.
 - Consider having healthcare staff perform regular rounds to answer questions about COVID-19 from staff.
- Staff identified as close contacts of a COVID-19 case should self-quarantine at home for 14 days and may return to work if symptoms do not develop.
 - See above for definition of a close contact.
 - Refer to CDC guidelines for further recommendations regarding home quarantine for staff.

Infection Control

Infection control guidance below is applicable to all types of correctional facilities. Individual facilities should assess their unique needs based on the types of exposure staff and incarcerated/detained persons may have with confirmed or suspected COVID-19 cases.

- All individuals who have the potential for direct or indirect exposure to COVID-19 cases or infectious materials (including body substances; contaminated medical supplies, devices, and equipment; contaminated environmental surfaces; or contaminated air) should follow infection control practices outlined in the CDC Interim Infection Prevention and Control Recommendations for Patients with Suspected or Confirmed Coronavirus Disease 2019 (COVID-19) in Healthcare Settings. Monitor these guidelines regularly for updates.
 - Implement the above guidance as fully as possible within the correctional/detention context. Some of the specific language may not apply directly to healthcare settings within correctional facilities and detention centers, or to

facilities without onsite healthcare capacity, and may need to be adapted to reflect facility operations and custody needs.

- Note that these recommendations apply to staff as well as to incarcerated/detained individuals who may come in contact with contaminated materials during the course of their work placement in the facility (e.g., cleaning).
- **Staff should exercise caution when in contact with individuals showing symptoms of a respiratory infection.** Contact should be minimized to the extent possible until the infected individual is wearing a face mask. If COVID-19 is suspected, staff should wear recommended PPE (see PPE section).
- **Refer to PPE section to determine recommended PPE for individuals persons in contact with confirmed COVID-19 cases, contacts, and potentially contaminated items.**

Clinical Care of COVID-19 Cases

- **Facilities should ensure that incarcerated/detained individuals receive medical evaluation and treatment at the first signs of COVID-19 symptoms.**
 - If a facility is not able to provide such evaluation and treatment, a plan should be in place to safely transfer the individual to another facility or local hospital.
 - The initial medical evaluation should determine whether a symptomatic individual is at higher risk for severe illness from COVID-19. Persons at higher risk may include older adults and persons of any age with serious underlying medical conditions such as lung disease, heart disease, and diabetes. See CDC's website for a complete list, and check regularly for updates as more data become available to inform this issue.
- **Staff evaluating and providing care for confirmed or suspected COVID-19 cases should follow the CDC Interim Clinical Guidance for Management of Patients with Confirmed Coronavirus Disease (COVID-19) and monitor the guidance website regularly for updates to these recommendations.**
- **Healthcare staff should evaluate persons with respiratory symptoms or contact with a COVID-19 case in a separate room, with the door closed if possible, while wearing recommended PPE and ensuring that the suspected case is wearing a face mask.**
 - If possible, designate a room near each housing unit to evaluate individuals with COVID-19 symptoms, rather than having them walk through the facility to be evaluated in the medical unit.
- **Clinicians are strongly encouraged to test for other causes of respiratory illness (e.g., influenza).**
- **The facility should have a plan in place to safely transfer persons with severe illness from COVID-19 to a local hospital if they require care beyond what the facility is able to provide.**
- **When evaluating and treating persons with symptoms of COVID-19 who do not speak English, using a language line or provide a trained interpreter when possible.**

Recommended PPE and PPE Training for Staff and Incarcerated/Detained Persons

- **Ensure that all staff (healthcare and non-healthcare) and incarcerated/detained persons who will have contact with infectious materials in their work placements have been trained to correctly don, doff, and dispose of PPE relevant to the level of contact they will have with confirmed and suspected COVID-19 cases.**
 - Ensure that staff and incarcerated/detained persons who require respiratory protection (e.g., N95s) for their work responsibilities have been medically cleared, trained, and fit-tested in the context of an employer's respiratory protection program.
 - For PPE training materials and posters, please visit the CDC website on Protecting Healthcare Personnel.
- **Ensure that all staff are trained to perform hand hygiene after removing PPE.**
- **If administrators anticipate that incarcerated/detained persons will request unnecessary PPE, consider providing training on the different types of PPE that are needed for differing degrees of contact with COVID-19 cases and contacts, and the reasons for those differences (see Table 1). Monitor linked CDC guidelines in Table 1 for updates to recommended PPE.**
- **Keep recommended PPE near the spaces in the facility where it could be needed, to facilitate quick access in an emergency.**
- **Recommended PPE for incarcerated/detained individuals and staff in a correctional facility will vary based on the type of contact they have with COVID-19 cases and their contacts (see Table 1). Each type of recommended PPE is defined below. As above, note that PPE shortages are anticipated in every category during the COVID-19 response.**

- **N95 respirator**
See below for guidance on when face masks are acceptable alternatives for N95s. N95 respirators should be prioritized when staff anticipate contact with infectious aerosols from a COVID-19 case.
- **Face mask**
- **Eye protection** – goggles or disposable face shield that fully covers the front and sides of the face
- **A single pair of disposable patient examination gloves**
Gloves should be changed if they become torn or heavily contaminated.
- **Disposable medical isolation gown or single-use/disposable coveralls, when feasible**
 - If custody staff are unable to wear a disposable gown or coveralls because it limits access to their duty belt and gear, ensure that duty belt and gear are disinfected after close contact with the individual. Clean and disinfect duty belt and gear prior to reuse using a household cleaning spray or wipe, according to the product label.
 - If there are shortages of gowns, they should be prioritized for aerosol-generating procedures, care activities where splashes and sprays are anticipated, and high-contact patient care activities that provide opportunities for transfer of pathogens to the hands and clothing of staff.
- **Note that shortages of all PPE categories are anticipated during the COVID-19 response, particularly for non-healthcare workers. Guidance for optimizing the supply of each category can be found on CDC's website:**
 - **Guidance in the event of a shortage of N95 respirators**
 - Based on local and regional situational analysis of PPE supplies, **face masks are an acceptable alternative when the supply chain of respirators cannot meet the demand.** During this time, available respirators should be prioritized for staff engaging in activities that would expose them to respiratory aerosols, which pose the highest exposure risk.
 - **Guidance in the event of a shortage of face masks**
 - **Guidance in the event of a shortage of eye protection**
 - **Guidance in the event of a shortage of gowns/coveralls**

Classification of Individual Wearing PPE	N95 respirator	Face mask	Eye Protection	Gloves	Gown/ Coveralls
Incarcerated/Detained Persons					
Asymptomatic incarcerated/detained persons (under quarantine as close contacts of a COVID-19 case*)	Apply face masks for source control as feasible based on local supply, especially if housed as a cohort				
Incarcerated/detained persons who are confirmed or suspected COVID-19 cases, or showing symptoms of COVID-19		X			
Incarcerated/detained persons in a work placement handling laundry or used food service items from a COVID-19 case or case contact				X	X
Incarcerated/detained persons in a work placement cleaning areas where a COVID-19 case has spent time	Additional PPE may be needed based on the product label. See CDC guidelines for more details.			X	X
Staff					
Staff having direct contact with asymptomatic incarcerated/detained persons under quarantine as close contacts of a COVID-19 case* (but not performing temperature checks or providing medical care)		Face mask, eye protection, and gloves as local supply and scope of duties allow.			

Classification of Individual Wearing PPE	N95 respirator	Face mask	Eye Protection	Gloves	Gown/Coveralls
Staff performing temperature checks on any group of people (staff, visitors, or incarcerated/detained persons), or providing medical care to asymptomatic quarantined persons		X	X	X	X
Staff having direct contact with (including transport) or offering medical care to confirmed or suspected COVID-19 cases (see CDC infection control guidelines)	X**		X	X	X
Staff present during a procedure on a confirmed or suspected COVID-19 case that may generate respiratory aerosols (see CDC infection control guidelines)	X		X	X	X
Staff handling laundry or used food service items from a COVID-19 case or case contact				X	X
Staff cleaning an area where a COVID-19 case has spent time	Additional PPE may be needed based on the product label. See CDC guidelines for more details.			X	X

Classification of Individual Wearing PPE

* If a facility chooses to routinely quarantine all new intakes (without symptoms or known exposure to a COVID-19 case) before integrating into the facility's general population, face masks are not necessary.

** A NIOSH-approved N95 is preferred. However, based on local and regional situational analysis of PPE supplies, face masks are an acceptable alternative when the supply chain of respirators cannot meet the demand. During this time, available respirators should be prioritized for procedures that are likely to generate respiratory aerosols, which would pose the highest exposure risk to staff.

Verbal Screening and Temperature Check Protocols for Incarcerated/Detained Persons, Staff, and Visitors

The guidance above recommends verbal screening and temperature checks for incarcerated/detained persons, staff, volunteers, and visitors who enter correctional and detention facilities, as well as incarcerated/detained persons who are transferred to another facility or released from custody. Below, verbal screening questions for COVID-19 symptoms and contact with known cases, and a safe temperature check procedure are detailed.

- **Verbal screening for symptoms of COVID-19 and contact with COVID-19 cases should include the following questions:**
 - *Today or in the past 24 hours, have you had any of the following symptoms?*
 - *Fever, felt feverish, or had chills?*
 - *Cough?*
 - *Difficulty breathing?*
 - *In the past 14 days, have you had contact with a person known to be infected with the novel coronavirus (COVID-19)?*
- **The following is a protocol to safely check an individual's temperature:**
 - Perform hand hygiene
 - Put on a face mask, eye protection (goggles or disposable face shield that fully covers the front and sides of the face), gown/coveralls, and a single pair of disposable gloves
 - Check individual's temperature
 - **If performing a temperature check on multiple individuals, ensure that a clean pair of gloves is used for each individual and that the thermometer has been thoroughly cleaned in between each check.** If disposable or non-contact thermometers are used and the screener did not have physical contact with an individual, gloves do not

need to be changed before the next check. If non-contact thermometers are used, they should be cleaned routinely as recommended by CDC for infection control.

- Remove and discard PPE
- Perform hand hygiene
